

The layers of the Rainforest

By Ben

The first layer

The first layer is called the forest floor it is very dark. Things decay very fast down there.

This is the forest floor

The second layer

The second layer is called the understory, this is made of insects, frogs and other animals.

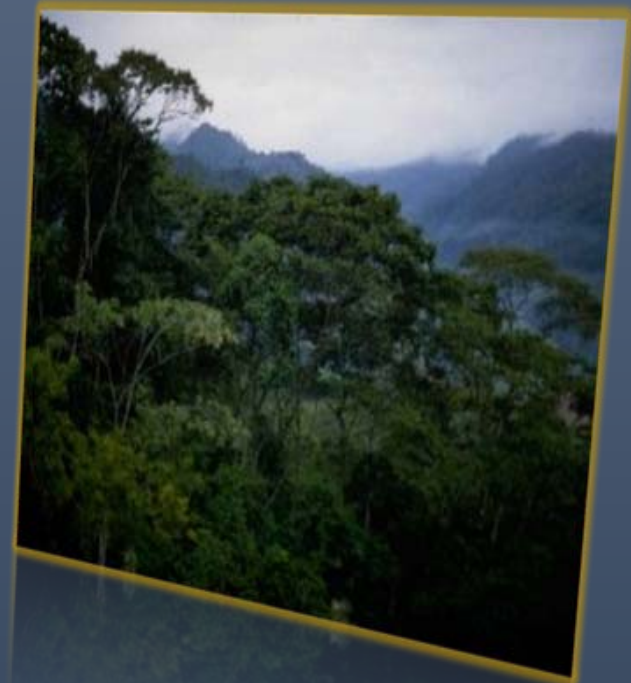

A low-angle photograph looking up into a dense forest canopy. Sunlight filters through the thick layer of green leaves, creating bright, dappled light patterns. Several dark tree trunks and branches are visible, crisscrossing the frame. The overall atmosphere is lush and vibrant.

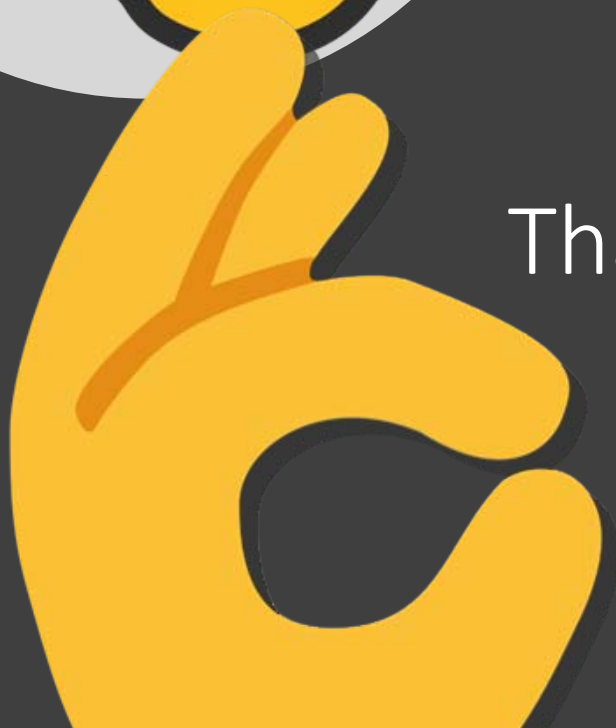

The third layer

The third layer is called the canopy layer. This layer forms a roof over the two remaining layers.

The final layer

The final layer is made out of the tallest trees. There are only flying things up there and monkeys.

Thankyou for watching
